INTRODUCTION

This document presents forecasts of key aviation activity measures for fiscal years 1978, 1979, 1980, 1983, and 1988 for 894 airports, RAPCON's and RATCC's. The forecasts are prepared to meet the planning needs of the Federal Aviation Administration (FAA) offices and services concerned with future traffic levels at these facilities and do not represent official agency commitments. The airports selected for inclusion in this publication met at least one of the following criteria:

- Existing FAA tower;
- Candidate for an FAA tower;
- Currently receiving or forecast to receive certificated route air carrier or scheduled air taxi commuter service; or
- Any general aviation airport which will exceed 60,000 itinerant and/or 100,000 total operations annually by 1978.

The report is organized by FAA region and within each region by state. National and regional summaries are included in the introduction. The airports in each state are listed alphabetically by community. Towered airports, nontowered airports, new towers built in FY 1976, tower candidates, and towers decommissioned by FY 1976 are so labeled under their location identifiers (LOC ID). Note that changes in the tower status of an airport since the beginning of the 1977 transition quarter are not included.

These forecasts reflect the comments received from the FAA regional offices concerning a preliminary 1978-1988 Terminal Area Forecast (TAF), and they are consistent with total United States aviation forecasts published in the FAA report Aviation Forecasts, Fiscal Years 1977-1988. Although specific values are shown for fiscal years 1978, 1979, 1980, 1983, and 1988, it must be recognized that year-to-year fluctuations are difficult to forecast precisely. Therefore, the projections reflect the trend or average conditions expected during the forecast period.

ACTIVITY MEASURES FORECASTED

In this publication, the data forecasted for each airport are air carrier enplanements, air taxi enplanements, air carrier operations, air taxi operations, total itinerant operations, total aircraft operations, instrument operations, and instrument approaches.

- ° The air carrier enplanement data include scheduled air carrier, intrastate, supplemental, and foreign flag traffic. Included within the international count are passengers who disembark at international airports to go through customs and then reenplane.
- ° Air taxi enplanements include commuter traffic as well as estimates of nonscheduled air taxi enplanements. The operations counts forecasted in this publication measure aircraft activity at each airport.
- ° Air carrier and air taxi operations are defined as arrivals or departures from an airport by such operators.
- ° Itinerant operations include all air taxi and air carrier operations plus general aviation and military operations which originate from or are destined for another airport.
- ° Total operations include all itinerant operations plus local operations. Local operations are landings and takeoffs performed by aircraft operating in the local traffic pattern.
- ° An instrument operation occurs when an FAA terminal control facility handles the arrival, departure, or overflight of an aircraft on an IFR flight plan or provides IFR separation to other aircraft. The data published in this TAF include both instrument operations at primary and secondary facilities. Primary facilities are FAA towered airports with radar approach control, while secondary facilities have FAA towers without radar approach control. Those instrument operations occurring at secondary airports are credited to both the primary facility and the airport where the physical operation occurs. Non-IFR instrument counts at existing Terminal Control Area (TCA) facilities and airports with Stage III of expanded area radar service are included under instrument operations. The facility forecasts are not adjusted for any new IFR locations or for additional Stage III installations.

Instrument approaches are a count of approaches to an airport, with intent to land, by an aircraft flying in accordance with an IFR flight plan, when visibility is less than three miles or when the ceiling is below the minimum initial approach altitude.

DATA SOURCES

The base year enplanement data reported at each airport represent activity for fiscal year 1975. Certificated carrier traffic is reported in a joint FAA/CAB report, Airport Activity Statistics. These data are supplemented by an FAA survey of air taxi and intrastate operators, by reports of foreign flag traffic from the Immigration and Naturalization Service, and by state aviation commission and airport manager reports. These sources are used to compile enplanement figures for both towered and nontowered airports.

Aircraft operations data are compiled from a variety of sources. Operations at FAA towered airports are from FAA Air Traffic Activity reports for FY 1976. Air carrier operations at nontowered airports were obtained from the Airport Activity Statistics. Other operations at nontowered airports are estimates based on special traffic surveys and on estimates provided in the FAA Airport Master Record, FAA Form 5010-1.

Instrument operations at FAA towered airports and instrument approaches for all airports are reported in the Air Traffic Activity report, while estimates of based aircraft are reported in the Airport Master Record. Itinerant occupants are calculated from the reported enplanement and operations data.

FORECAST METHODOLOGY

The general approach to the facility forecasts presented here is "top-down." For each series, the national forecasts were distributed over the regions, states, and then to individual airports. Supplementing this technique is a forecast of air carrier enplanements at the airports in the 23 largest hubs in the continental United States. At other air carrier airports, average aircraft size, the carriers serving the airport, their historic and present capacity in terms of frequency and aircraft type, the markets served, and the composition of future fleets of the relevant carriers were used to test the internal consistency of the air carrier forecasts. Changes in carrier status from commuter to certificated carrier also influence the forecasts.

Forecasts of general aviation aircraft operations were based on past trends modified by known considerations such as airport facilities, available reliever airports, and official attitudes toward general aviation activity at the subject airport. Military operations were held nearly constant at those airports with assigned military units and at some others with a history of stable levels of military operations. At those airports with no assigned military units, the activity was frequently decreased to a nominal level or to zero.

The individual airport instrument operations forecasts reflect assumptions about the increased utilization of avionics by general aviation users. No additions to the number of TCA's or expanded radar locations were assumed.

To forecast annual instrument approaches (AIA's), it was assumed that growth in the amount of instrument flight rules (IFR) flying has the strongest impact on AIA's. By assuming that IFR flying includes all air carrier operations, 75 percent of the air taxi operations, and 30 percent of the general aviation itinerant activity, a growth rate of IFR flying for each airport could be calculated. This growth rate was applied to the FY 1976 AIA count to obtain AIA forecasts.

While the frequency of IFR weather conditions also influences the number of AIA's, the base year counts were assumed to reflect average weather conditions at that airport. Consequently, no adjustments were made in the AIA forecasts due to unusual weather conditions throughout FY 1976.

The operations forecasts are further modified in three ways. First, because the commuter and nonscheduled air taxi service seems to be the most volatile of the series projected in this publication, special consideration was given to these forecasts. By using the number of commuter or scheduled air taxi operators as an indicator, a growth rate for air taxi operations was determined individually for each airport served. Judgments made about both the strength of the carrier itself and the strength of market served are the basis of these rates.

Second, the aircraft operations were adjusted in order to account for the capability of an airport to handle aircraft. Unless additional facilities such as runways or electronic equipment which can safely reduce separation standards are installed, as airports reach a certain level of operations, aircraft will tend to use other nearby airports. Consequently, since no expansion of airport facilities has been assumed for this forecast, as airports approach saturation the growth of aircraft operations at that airport falls below the national average growth rates. In the years after the present operating environment has been saturated, the forecasted total operations were assumed to be constant.

Third, as mentioned earlier, air carrier enplanements at the 23 largest hubs were adjusted. To make these individualized adjustments a model was developed for forecasting enplanements disaggregated into hub originating, connecting, and returning passengers. Moreover, separate equations were developed for hubs characterized as industrial cities, trade centers, or recreation areas, and as connecting cities, terminating points, or intermediate cities. The results of the analysis showed that passengers originating at hubs are primarily dependent on income generated in the hub, while the number of connectors and returning passengers depends on the incomes at associated destinations. From forecasts of the incomes of these various hubs, growth rates for enplanements at each of the hubs were generated. These growth rates, which for the most part deviated from the national average, were used to adjust the enplanement forecasts at the 23 largest hubs.

After the forecasts were generated and the adjustments made, the FAA regional planning offices were asked to comment on them. Updates of based aircraft and FY 1976 activity at nontowered airports were included in these regional comments.

In addition, information was received on plans for new runways, on the possibility of new commuter service, and on airports expected to deviate from the national trends. These comments were incorporated in the TAF subject to the constraints imposed by the national forecasts.

DESCRIPTION OF TABLES

Except for one additional table, the basic format of the TAF has remained unchanged from last year's publication. Table I provides a summary of growth factors for general aviation itinerant and total operations by region and state. These growth rates may be used as a guide for making or reviewing projections for airports not included in this year's TAF.

Table II, Airport Ranking of Air Carrier Passenger Enplanements, is a summary in rank order of the top 150 air carrier airports in terms of enplaned passengers, percent of total passenger activity, and the cumulative percent for fiscal year 1975. Table III shows national and regional summaries of the number of towers, air carrier enplaned passengers, air carrier operations, itinerant operations, total operations, and instrument operations at towers, number and percent distribution. As in previous years, regional summary tables precede each section. Included in these tables are state and regional totals for historical and projected activity statistics.

Table IV lists the airports which are forecasted to reach saturation of 90 percent of their capacity during the forecast period unless additional facilities are installed. For the purposes of this forecast, capacity is defined as one-and-two-thirds of the practical annual capacity (PANCAP). PANCAP provides an assessment of the runway component of an airport complex and does not include other airfield and terminal building elements. The computation of PANCAP was based on the existing runway configuration at each airport and does not include runway programs under development or programmed for the future. As an indication of needed expansion, potential demand for aircraft operations in 1988 is also indicated. In addition, a map showing the location of FAA towered airports in the United States is included. The towers are indicated by various sized dots which portray the amount of activity at that tower.

Table V, the new table, lists the nontowered airports which, according to the activity forecasts, will qualify for tower candidacy by FY 1988. These airports are listed according to the year in which they qualify. Further discussion of the criteria can be found in the Airway Planning Standard Number One, FAA Order 7031.2B (January 24, 1977).

TABLE V

LISTING OF NONTOWERED AIRPORTS EXCEEDING
THE SIMPLE CRITERIA* FOR TOWER CANDIDACY
DURING THE FORECAST PERIOD

<u>YEAR</u>	<u>CITY, STATE</u>	<u>AIRPORT</u>	<u>LOCATION IDENTIFIER</u>
1976	Bethel, AK	Bethel	BET
	Dillingham, AK	Dillingham	DLG
	Caldwell, NJ	Caldwell Wright	CDW
	Cumberland, WY	Cumberland Muni	CBE
	Hamilton, OH	Hamilton	HAO
	Mosinee, WI	Central Wisconsin	CWA
	Lawrence, MA	Lawrence Muni	LWM
	Auburn, WA	Auburn Muni	S50
	Kaunakakai, HI	Kaunakakai	MKK
	Greelley, CO	Weld County Muni	GXY
	Naples, FL	Naples Muni	APF
	Aguadilla, PR	Borinquen	BQN
	Isla de Vieques, PR	Vieques	VQS
	Houston, TX	David Wayne Hooks Mem.	DWH

* NOTE: When the aircraft activity at an airport is such that the following relationship is met, it meets the simple criteria for tower candidacy.

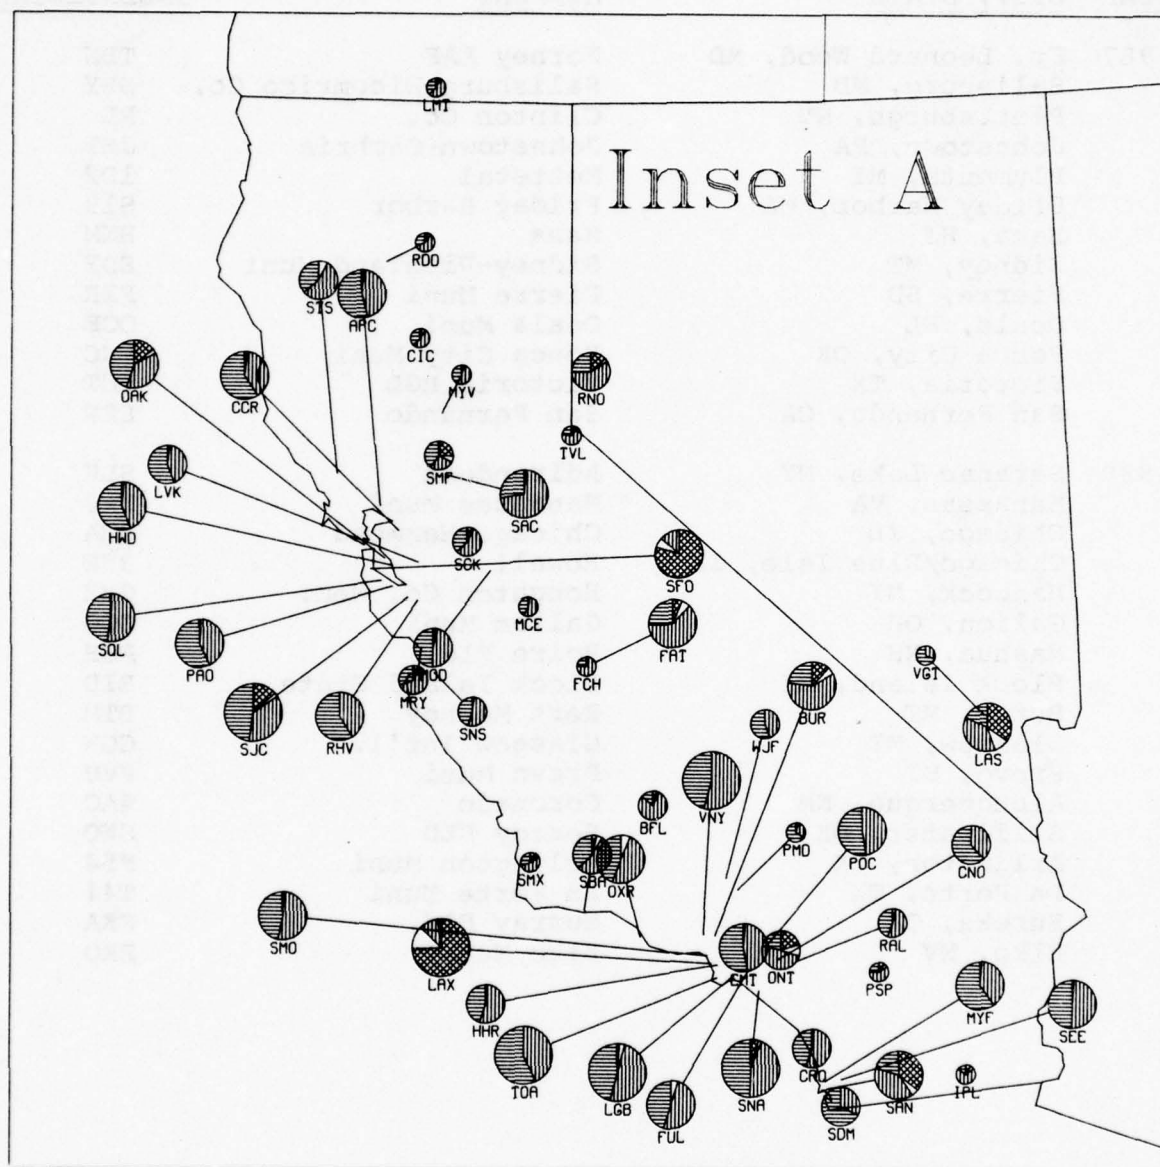

<u>Type of Operations</u>		<u>Ratio Value</u>
(1)	<u>Number of Air Carrier Operations</u> 15,000	= xxxxxx
(2)	<u>Number of Air Taxi Operations</u> 25,000	= xxxxxx
(3)	<u>Number of General Aviation and Military Operations (local plus itinerant)</u> 200,000	= xxxxxx
Sum of Ratio Values		<u>If 1 or greater, location is a candidate</u>

For further clarification of this ratio refer to Report No. ASP-75-4, Establishment Criteria for Airport Traffic Control Towers.

<u>YEAR</u>	<u>CITY, STATE</u>	<u>AIRPORT</u>	<u>LOCATION IDENTIFIER</u>

F.A.A. Tower Activity - 1976

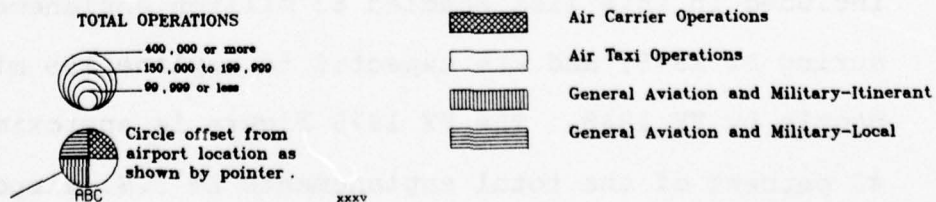

tivity - 1976

LEGEND

KKKV

HIGHLIGHTS

The Terminal Area Forecast includes actual and forecast data for 894 facilities. This includes 422 airports with ATC towers and nontowered airports. Air carrier service is currently offered at 498 airports but only 299 of these have ATC towers. However, enplaned passengers at these towered facilities (206 million) represent 98 percent of the 211 million air carrier enplanements in FY 1975.

The forecasts of passenger and aircraft activity are generally lower in this TAF when compared to the 1976 edition. This phenomenon is a result of both lower forecasted growth rates in air carrier and local operations and recorded activity levels which are lower in FY 1976 than in FY 1975.

Of the airports included in the TAF, 72 are expected to be using at least 90 percent of their current capacity during the forecast period. Because no expansion of the airport capacity has been assumed, aircraft operations at these airports are not forecasted to increase beyond the saturation level. The 34 air carrier airports included in this list handled 83 million enplanements during FY 1975, and are expected to enplane 155 million people by FY 1988. The FY 1975 figure is approximately 40 percent of the total enplanements at U.S. airports, while

the 70 million enplanements at the large hubs in the list encompass 33 percent of total U.S. enplanements. Since the growth in enplanements is expected to double at these airports by 1988, the potential demand for aircraft operations can also be expected to increase. This demand at air carrier airports is forecasted to exceed the forecasted activity levels by 2.8 million operations by FY 1988. Almost 40 percent of this excess demand for operations at airports nearing saturation is in the large hubs.

Just as several air carrier airports are expected to approach saturation by FY 1988, so are 38 general aviation airports. If demand for service at these airports continues to grow at expected rates, currently attainable levels of activity will be exceeded by 2.8 million general aviation operations by FY 1988. To accommodate such demand by 1988, additional facilities such as runways or electronic aids will be required at the airports listed in Table IV.

To understand some differences between this and earlier TAFs, a comparison of these airports with corresponding airports from the January 1976 TAF is necessary. Since the earlier publication examined only airports "expected to reach saturation of their current facilities during the forecast period," similar data was extracted from the current TAF data base. Twenty of the airports in Table IV are expected

to be saturated sometime during the 1980s. Note that this number is 44 airports lower than that in the 1976 TAF. This effect is caused in the large hubs by a decrease in the expected growth rate of air carrier operations vis-a-vis the 1976 TAF, and in the GA airports, by a similar decrease in the expected growth of GA local operations at FAA towered airports.

Since this current version of the TAF implies that the existing airspace is not expected to be as congested relative to the 1976 TAF, the need for additional runways or electronic landing aids in general is less critical. However, this analysis does not consider the peaking which occurs at some airports. Depending on the distribution of traffic throughout the day, an airport can experience congestion, even though its total annual activity is not approaching saturation levels. Consequently, although saturation of the airport environment is one indicator of congestion, other measures are appropriate for determining when an airport qualifies for expansion.

Just as increases in aircraft activity may necessitate expansion of an airport's capacity, such increases may also affect aviation safety. In order to be responsive to such safety needs, the FAA will install air traffic control towers at airports where the benefits from the tower exceed its costs. To determine which nontowered airports are candidates for such consideration, a simplified criterion outlined in the Airway

Planning Standards is used. The application of the criteria to the forecasts published in this TAF determined that the airports listed in Table V may qualify for detailed cost-benefit analysis some time during the forecast period.

Given the current forecasts and FY 1976 data, 118 nontowered airports will meet the simplified criteria for tower candidacy. Of these airports, 21 already qualify for consideration for towers according to FY 1976 data. By 1988 a total of 118 nontowered airports are expected to qualify for detailed cost-benefit analysis. Of these airports, most are in the Great Lakes, Eastern, Western, and Southwest regions, while the Central and Pacific regions have the fewest qualifying airports. This distribution of tower candidates reflects number of airports in a region approaching required activity levels, and does not necessarily reflect the growth of activity in the region.

Distribution: W-1; R-1 (minus AS/AT/PL); RPL-2, RAS-2;
RAT-2; ZMS-411; FAS-1, FAT-2, FAT-3 (minimum)

Appendix I

Notes, Definitions, Limitations, Cautions

1. RAPCON's and RATCC's are military Radar Approach Control Facilities, Air Force and Navy, respectively.
2. The count of supplemental air carrier enplanements received from the CAB was based on seats rather than passengers enplaned. Consequently, where supplemental enplanements were added to the other air carrier enplanement count, these data are overestimated.
3. The air carrier operations data at various airports such as La Guardia included helicopter operations by New York Airways, Inc.

Service by SFO Helicopter Airlines, Inc., at Oakland and San Francisco was discontinued during FY 1976. Because the aircraft and passenger traffic counts at these airports for FY 1976 did include this helicopter activity, the forecasts are reduced to reflect the lost service.

4. The itinerant occupants figure is an estimate of all people who land at or take off from an airport. It includes passengers and crew of air carrier, air taxi, military, and general aviation aircraft. This statistic is provided for FY 1975 only and is not forecasted for future years.
